

# Yuriy Korotovskikh

SENIOR FRONTEND DEVELOPER · WEB3 ENGINEER · FINTECH SPECIALIST

Yerevan, Republic of Armenia

✉ ukorotovskiy@gmail.com | 🌐 ukorovl | 🌐 yuriy-korotovskikh | ✉ @ykorotovskikh | 🌐 its\_korotovskikh

## Summary

Senior Frontend Engineer in Crypto. I specialize in building scalable client-side applications, designing dApp interfaces and architecture, developing blockchain tools, SDKs and Web3 infrastructure.

Building frontend applications since 2020, with a focus on high-performance interfaces for Web3 and fintech products.

Expert in building accessible, user-friendly interfaces with a focus on fast and smooth UX that drives business value.

## Skills

|                  |                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Languages</b> | <b>Proficiency</b> - JavaScript, TypeScript, Solidity, HTML, CSS, PHP, <b>Working Knowledge</b> - Go, Elixir, Python           |
| <b>Frontend</b>  | React, Next.js, Astro, Vue.js, Redux, Effector, Zustand, Web Workers, Storybook, Vite, Rollup, Tailwind, WebAssembly, TanStack |
| <b>Web3</b>      | Viem, Wagmi, Ethers, MetaMask, WalletConnect, Ledger, RainbowKit, Reown AppKit                                                 |
| <b>DevOps</b>    | Docker, Ansible, TeamCity, Nix, GitHub Actions CI                                                                              |
| <b>Backend</b>   | Node.js, SQL, REST, JSON-RPC, WebSocket                                                                                        |
| <b>Testing</b>   | Jest, Vitest, Cypress, Playwright, Synpress, Hardhat                                                                           |
| <b>UX</b>        | Interaction design, Figma, Design systems, User research, Accessibility                                                        |

## Work Experience

### Mercuryo

London, United Kingdom (remote)

SENIOR FRONTEND DEVELOPER

Sept. 2025 - Current

*Mercuryo is one of the leading companies in crypto-powered payments infrastructure, providing a wallet-integrated on/off-ramp widget, Spend Card, and Wallet that unify fiat and crypto rails for apps and exchanges worldwide (10M users as of May 2025).*

- Owned the Mastercard Crypto Credentials frontend, including wallet linking, message/transaction signing, and error-handling flows across partner wallets. Led migration from Web3Modal to Reown AppKit.
- Delivered end-to-end frontend flows for Spend Card and Ledger Spend users: eligibility checks, KYC handoff, card issuance, top-ups, limits, transaction history, balance states, and UI mocks.
- Built and maintained partner wallet integrations (Ledger, MetaMask, Trust Wallet, and others) in a React + Redux widget with white-label embedding, theming, feature flags, localization, and iframe-host communication.
- Expanded automated test coverage for high-risk payment flows using Playwright E2E and Vitest unit tests (on/off-ramp, KYC redirects, approvals/signatures, and card onboarding).
- Integrated core Web3 UX primitives: WalletConnect/Reown AppKit connection, multi-chain EVM support, message/transaction signing, and resilient retry/error states across wallets.
- Improved production diagnostics by instrumenting client-side observability with Sentry and product event analytics.
- Built AI-assisted engineering workflows by defining repository agent rules and reusable skills for code generation, test authoring, and review checklists.

### Diffuse Prime

Limassol, Cyprus (remote, contract)

FOUNDING FRONTEND ENGINEER

Aug. 2025 - Mar. 2026

*Diffuse Prime is a ZK/TEE-powered non-custodial lending protocol for structured leverage deals.*

- Designed architecture and built a Next.js + TypeScript frontend dApp from scratch, including wallet connection, on-chain interactions, and user flows for lenders and borrowers. Integrated Sentry, logging, and event analytics to monitor the product.
- In collaboration with the design team, implemented a modern ESM UI kit with Radix UI, Tailwind, and TanStack libraries.
- Implemented a testing strategy with Vitest unit tests, visual regression tests, Lighthouse tests, and Playwright end-to-end tests with local network fixtures. Covered more than 90% of the codebase with tests.
- Designed and implemented full cycle CI/CD pipelines for the frontend, ensuring integration and delivery to Vercel.
- Designed and implemented a Node.js indexer for processing on-chain events and integrated it with the Next.js API and Vercel cron jobs.
- Implemented a custom JavaScript SDK for interacting with the protocol, which was used across the frontend and other tools.
- Organized monorepo with npm workspaces, implemented automated release and versioning process with changesets, introduced best security practices and audits, and set up various checks in CI.

- Collaborated closely with founders as a sole frontend engineer to design and implement various features and visual elements, to ensure the product meets the needs of its users.
- Designed repository AI workflows by authoring agent operating rules, building task-specific agents (feature delivery, refactoring), and creating reusable prompt patterns for consistent output quality.

## Nil foundation

Limassol, Cyprus (remote)

FRONTEND DEVELOPER

May. 2022 - Aug. 2025

*Nil Foundation is an Ethereum L2 startup working on Ethereum horizontal scalability.*

- Built from scratch and released proof market DEX-like interface, which is a decentralized exchange of computation powers for proofs generation.
- Built a block explorer for the NIL Layer 2 chain with detailed views for blocks, transactions, and accounts. Designed and optimized the frontend architecture for performance and scalability. Also contributed to the Node.js backend powering the explorer.
- Developed an interactive, sharding-specific smart contract playground for the NIL chain. The tool enables users to write and compile Solidity code, save snippets, deploy contracts, and interact with them — all within a unified interface.
- Built a custom JavaScript SDK for interacting with the Nil blockchain, tailored to support SSZ serialization and Poseidon hashing. This library became the foundation for multiple critical tools, including a CLI, Hardhat plugin, and browser wallet extension.
- Developed and maintained the corporate website using Next.js with a Strapi CMS backend, along with additional marketing pages to support product outreach.
- Created and maintained a reusable React UI component library, adopted across nearly all NIL interfaces to ensure design consistency and development efficiency.
- Built and maintained CI/CD pipelines using GitHub Actions CI, Ansible, and Jinja.

## InfoTeCS JSC

Saint Petersburg, Russia (on-site)

FRONTEND DEVELOPER

Mar. 2021 - May. 2022

*InfoTeCS is a cybersecurity company providing a range of secure communication solutions for corporate clients.*

- Built Remote Work Management System, a big internal React app, where employees could request remote work, track approval pipelines, and submit daily reports. I created interfaces, pages and forms, worked on performance optimizations and managed API workflows with Redux Saga. I also contributed to backend C# controllers and validations to support frontend logic.
- Contributed to Employee performance evaluation system - a large-scale web application built with ASP.NET and a legacy frontend stack using jQuery and Backbone.js.
- Developed React-based Artifact Management App. This internal tool allowed teams to upload, download, and manage build artifacts across multiple systems. All existing artifacts were aggregated in a dynamic responsive table with server-side sorting and filtering, making it easy for engineers to quickly locate, and interact with the files.
- Led frontend development for a Next.js documentation portal targeting foreign branches, combining static site generation with dynamic internal routing. This portal was a key touchpoint between the company and its foreign customers. One part of the app was public-facing, the other integrated into an internal doc system.
- Maintained React components library and closely collaborated with Design department to ensure consistent implementation of the design system.

## Oday Technologies

Moscow, Russia (remote)

FRONTEND DEVELOPER

Sept. 2020 - Mar. 2021

*Oday Technologies is a company specializing in the development of automation tools and information security.*

- Designed and developed a Vue 2 and Vuetify-based monitoring service, integrating interactive Leaflet maps for real-time data visualization and location tracking.
- Worked on a large analytics React application with a Python backend, where I created new UI elements, optimized loading time, and implemented advanced search across multiple sources.

## Education

### KSU(Kurgan State University)

Kurgan, Russia

BACHELOR DEGREE

Sep. 2014 - Aug. 2018

### UNECON(Saint Petersburg State University of Economics)

Saint-Petersburg, Russia

MASTERS DEGREE

Sep. 2018 - Jul. 2020
